BASIC-ABSTRACT:

The use of parts of a plant, esp. the stem and roots of plants of the genus Tinospora, is claimed for treating cancerous diseases of men and animals. The plants are pref. Tinospora malabarica, T. crispa, T. tuberculata, T. capillipes, T. baenzigeri, T. Bakis, Parabaena spp., Stephamia tetrandra and esp. Tinospora cordifolia. The substance may be used locally and/or orally.

USE/ADVANTAGE - The extd. cells of the stem and root can be used alone or together

with e.g. radiation therapy, surgery or chemotherapy. The extracts can be applied as solns. or as powder, as well as in pills etc. Tinospora cordifolia is known for its action against fever, diarrhoea, skin eruptions and chronic rheumatism, as well as for treating insect/snake/scorpion bites.

In an example, a patient with cancer of the throat of 8 years' duration, who had previously been treated with radiation, etc., has a growth that prevented her from taking liqs. or solids by mouth. A paste made from fresh, chopped Tinospora cordifolia roots, mixed with water was applied externally to the patient's neck, and juice pressed from the fresh chopped roots was administered orally. After 3 months, the throat began to open, after several more month's treatment (which included drinking the juice), the patient recovered, and medical investigation found no trace of the cancer. @(18pp Dwg.No.0/0)
